

## PFM Step-up DC/DC Converter, ME2108 Series

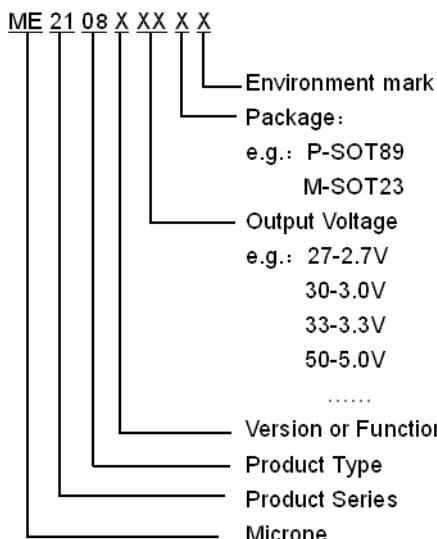

### General Description

ME2108 Series is a PFM Step-up DC/DC converter IC with low supply current by CMOS process. High frequency noise that occurs during switching is reduced by using advanced circuit designed, output voltage is programmable in 0.1V steps between 2.0~7.0V and maximum frequency is 180KHz(TYP.). A low ripple, high efficiency step-up DC/DC converter can be constructed of ME2108Xxx with only three external components. Also available is a CE(chip enable) function that reduce power dissipation During shut-down mode. ME2108Xxx is suitable for use with battery-powered instruments with low noise and low supply current.

### Features

- Low ripple and low noise
- Operating voltage range: 0.9V~6.5V
- Output voltage range: 2.0V~7.0V(step 0.1V)
- Output voltage accuracy:  $\pm 2.5\%$
- Output Current: If  $V_{IN}=3.0V$  and  $V_{OUT}=5.0V$ ,then  $I_{OUT}=400mA$
- Low start voltage:  $\leq 0.9V$ (at  $I_{OUT}=1mA$ )
- Maximum oscillator frequency: 180KHz(TYP.)
- High Efficiency: 85%(TYP.)
- Package: SOT23、SOT89、TO92

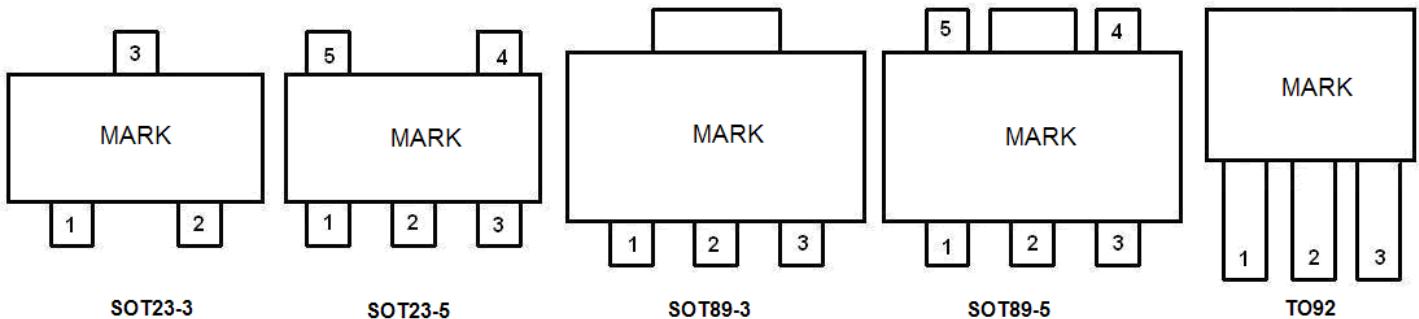

### Selection Guide

### Typical Application

- Power source for battery-powered equipment
- Power source for wireless mouse, wireless keyboard, toys, cameras, camcorders, VCRs, PDAs, and hand-held communication equipment
- Power source for appliances which require higher cell voltage than that of batteries used in the appliances

### Pin Configuration

EFFI	Efficiency			85		%

Note: 1、Diode use Schottky diode such as IN5817 or IN5819 (forward voltage drop:0.2V)

2、Inductor: 33 $\mu\text{H}$  ( $r<0.5\Omega$ )

3、Capacitor: Tantalum type 100 $\mu\text{F}$ 

### Operation Description

ME2108 step-up DC/DC converter charges energy in the inductor when Lx Transistor is on, and discharges the energy with the addition of the energy from input power source thereto, so that a higher output voltage than the input voltage is obtained. Following is the operation diagram.

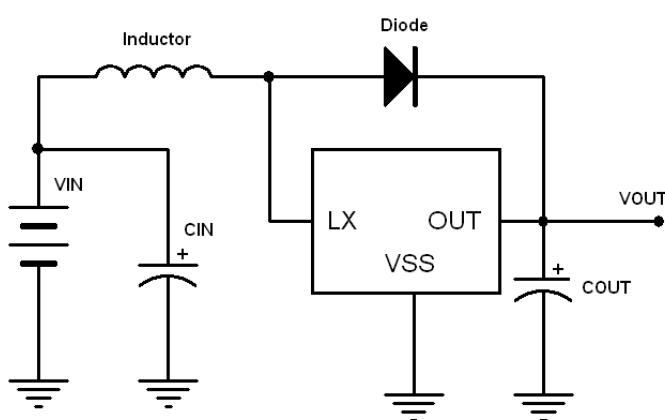

Switching DC/DC Step up Converter operating process

---

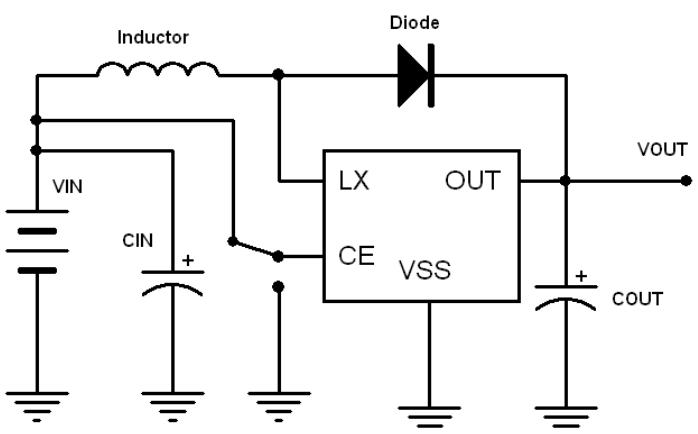

## Selection of Peripheral Components and Application Notes

- Power source for battery-powered equipment
- Power source for wireless mouse, wireless keyboard, toys, cameras, camcorders, VCRs, PDAs, and hand-held communication equipment
- Power source for appliances which require higher cell voltage than that of batteries used in the appliances
- Peripheral components should be selected carefully because they are greatly affect the performances of ME2108:
  - ✧ Use capacitor with a capacity of  $10\mu F$  or more ( too small capacity will lead to high output ripple), and with good frequency characteristics ( it is better to use Tantalum type). Besides, it is recommended the use of a capacitor with an allowable voltage which is at least three times the output set voltage. This is because there may be the case where a spike-shaped high voltage is generated by the inductor when Lx transistor is turned OFF.
  - ✧ Choose such an inductor that has sufficiently small d.c. resistance and large allowable current, and hardly reaches magnetic saturation. When the inductance value of the inductor is small, there may be the case where  $ILX$  exceeds the absolute maximum ratings at the maximum load.
  - ✧ Use a diode of a Schottky type with high switching speed.
- PCB Layout:
  - ✧ Set external components as close as possible to the IC and minimize the connection between the components and the IC. In particular, when an external component is connected to VOUT Pin, make minimum connection with the capacitor.
  - ✧ Make Vss pin sufficient grounding, otherwise, the zero level within IC will varied with the switching current. This may result in unstable operation of IC.

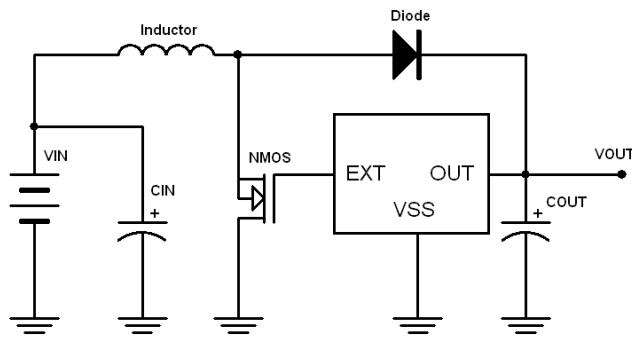

## Typical Applications

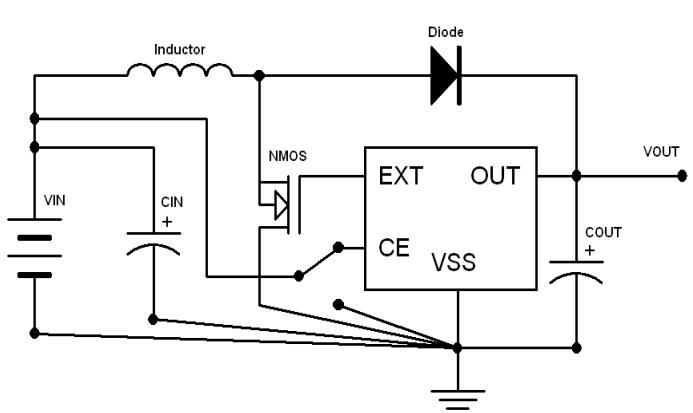

For use build in transistor

For use chip enable

For use external transistor

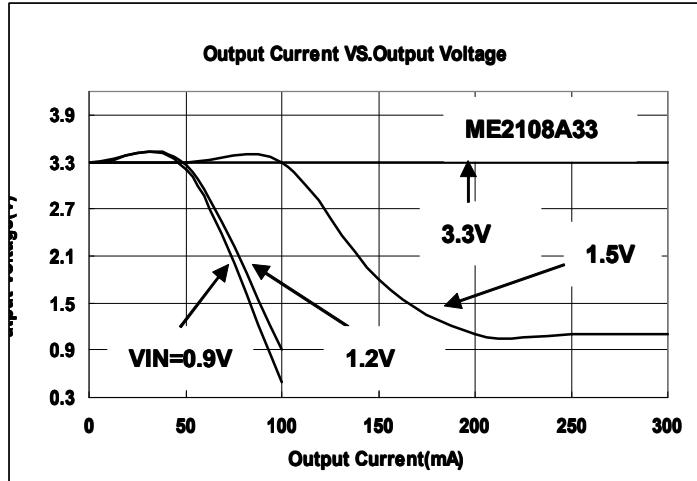

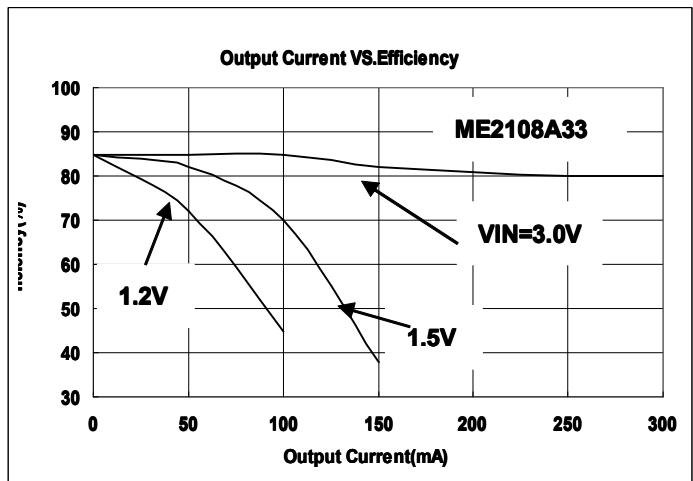

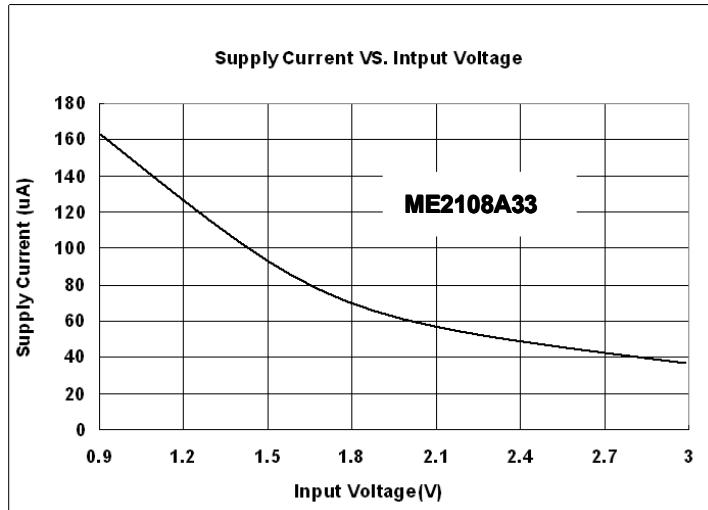

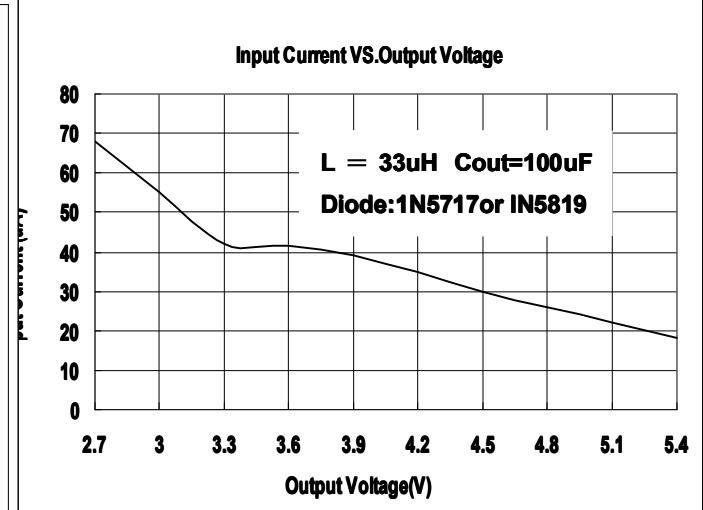

For use external transistor&amp;chip enable

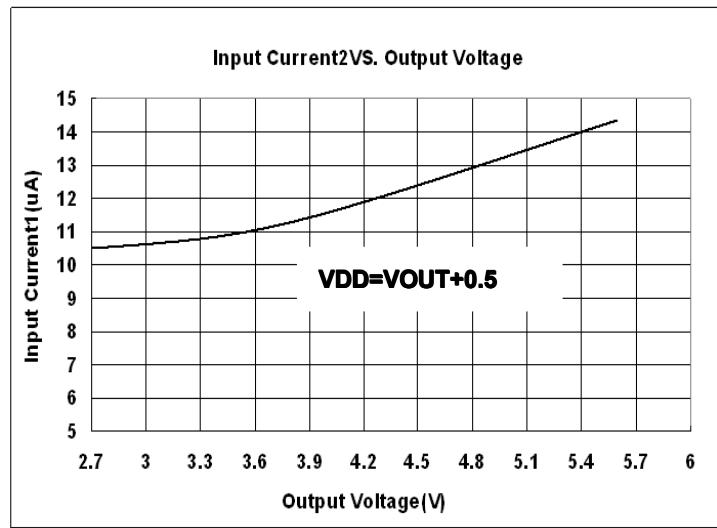

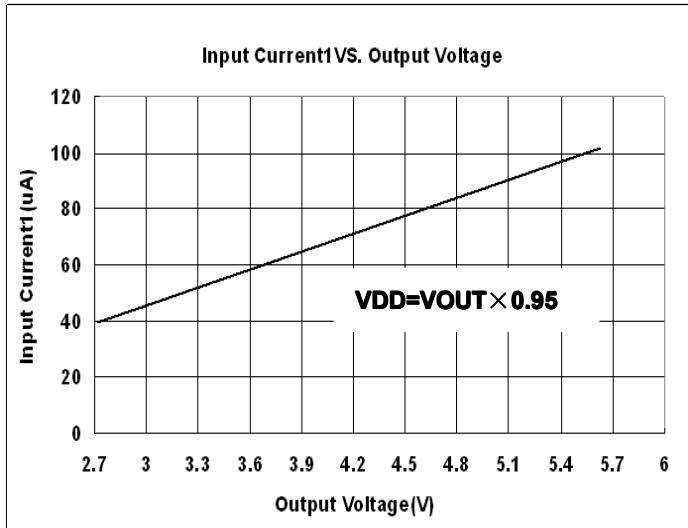

## Components:

- Inductor: 33uH(Sumida )
- Diode: IN5817、IN5819
- Capacitor: 47uF/16V(Tantalum Capacitor)
- Transistor: 2SD1628G、2SD3279
- NMOS: MEM2302、AAT9460、XP151、XP161

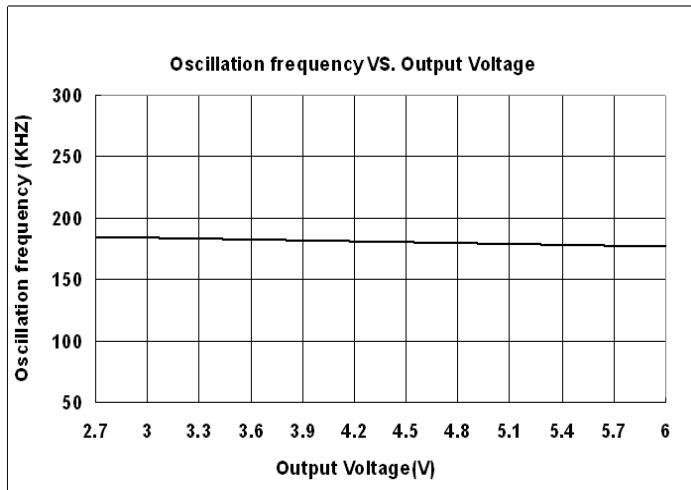

### Type Characteristics

(1) Output Current VS. Output Voltage ( $T_a = 25^\circ C$ )(2) Output Current VS. Efficiency ( $T_a = 25^\circ C$ )(3) Supply Current VS. Input Voltage ( $T_a = 25^\circ C$ )(4) Input Current VS. Output Voltage ( $T_a = 25^\circ C$ )

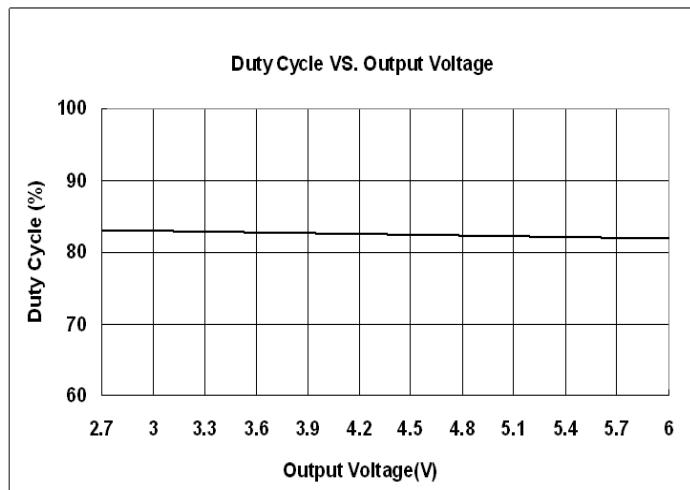

(5) Input Current1VS. Output Voltage (**T<sub>a</sub> = 25 °C**) (6) Input Current2VS. Output Voltage (**T<sub>a</sub> = 25 °C**)

(7) Oscillation frequency VS. Output Voltage

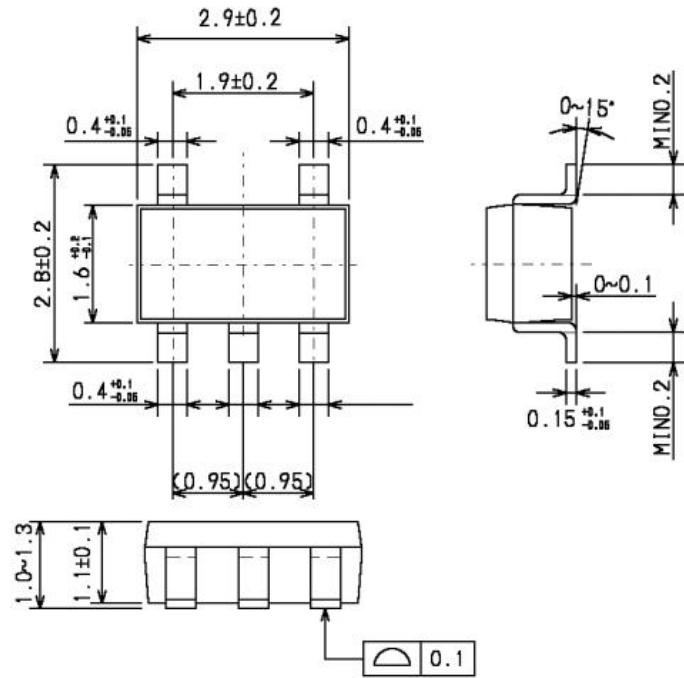

(8) Duty Cycle VS. Output Voltage (**T<sub>a</sub> = 25 °C**)
